

Product Group MFAM

Zinc-plated steel machine feet for damping tangential acceleration

Material

- Base body: zinc-plated steel
- Rubber: NBR 90 Shore

Product information

- The machine foot counteracts the tangential acceleration forces during the working process of machines. These forces cause an imbalance which stresses the clamping / bearing points of the machines.
- The load capacity of the screw (buckling length!) may be less than indicated in the table.
- Put the base with the flange completely screwed under the machine bed.
- From above screw the threaded stem in the hole of the machine bed.
- To align the machine, use the three holes in the top flange or the three milled grooves.
- Holes and grooves are arranged on the circumference at an angle of 120° to each other.
- Machine tools, injection moulding units, shearing machines, vibrators, printing machines, etc. ...
